AB	\nObjective: This study was aimed to investigate the prevalence of Hep B and C, gender distribution, route of transmission,\nfamily history of Hepatitis and treatment options.\nStudy Design and Setting: This was a cross sectional study conducted at Dr Mujahid's Lab Bhimber road Gujrat, Pakistan.\nMethodology: A total of 1181 individuals were included in this study. Among these 1181 individuals, 528 individuals were\nscreened for hepatitis B and C by immuno chromatographic test (ICT) at Dr. Mujahid’s Lab, Bhimber road, Gujrat while\nrest of the 653 individuals were asked about the hepatitis status by using a well-structured questionnaire. Other related\nquestions were also included like age, sex, marital status, mode of transmission, and about treatment to evaluate the risk\nfactors associated with disease. Data was analyzed by using SPSS 17.\nResults: Prevalence of hepatitis B and C was 1.37% and 8.26% in surveyed while 1.5% and 9.1% in screened population\nof district Gujrat respectively. In surveyed hepatitis C patients, 72% were females and 28% were males. Among these, 91%\npatients were married and only 9% were unmarried. In case of hepatitis C, 9% stated polluted water, 9% medicines, 5.5%\nfamily history, 3.7% barber, 2% endemic, 2% dental surgery, 2% unhygienic food and 2% typhoid fever as a cause of\ninfection while for hepatitis B, 33% individual’s stated low standard hoteling as a cause of infection. Overall, incidence\nof hepatitis was higher in screened individuals as compared to surveyed.\nConclusion: This study concluded that hepatitis prevalence is high in district Gujarat. Moreover, Hepatitis C is more\nfrequent than hepatitis B in this area.\n
